Research Brief III: Economic Report Influence Graph

Continuation — 2026-07-29

0. Status: what is already settled, so you do not redo it

Your Round 1 reply was received twice. It has been fully processed. **Do not re-run any of it.** Current disposition:

Item	Outcome
5. boc-mpr → statcan-cpi	Applied. Quote verified in the PDF.
6. boc-mpr → statcan-lfs	Applied. The LFS-Micro footnote verified exactly.
14. boc-mpr → bea-gdp	Applied. Now the first standard-compliant CA↔US edge in the graph.
13. boc-mpr → fed-fomc-statement	Your NOT-FOUND confirmed. The only Federal Reserve mention in the whole July 2026 Report is its 2% target. Correct call.
7. boc-mpr → statcan-national-accounts	Rejected. See below.
1, 2 (StatCan guides)	Held pending verification. Do not resubmit.

On item 7. You marked it DOCUMENTED on the strength of “*Sources: Statistics Canada and Bank of Canada calculations and estimates*”. The July 2026 MPR was then searched directly: the phrase “**national accounts**” **does not appear in it once**, and neither does “by industry”. The edge has been deleted and the refutation recorded. Your own reply had already said agency-only attributions were being treated as failures — this was the one place that rule was not applied.

Round A (Equalization) was excellent and is largely confirmed. Reading SOR/2007-303 s.3.1 directly verified the substance: the revenue-base *definitions* pin themselves to named Statistics Canada products, exactly as you reported. Provincial and Territorial Economic Accounts, System of Macroeconomic Accounts and Provincial Supply and Use Tables all appear repeatedly and verbatim.

But the citations were wrong, and that is now the blocking problem. You filed those definitions under “s. 1(1) and s. 8”. They are in **s. 3.1**. Section 8 is the *Nova Scotia* revenue base, a different Division entirely. You also returned fourteen quotes bundled under a single PROVISION heading marked “illustrative cluster” — which cannot be cited, because nothing in it carries its own section number.

Nothing from Round A has been added to the graph, purely because of this. The research is good and the packaging makes it unusable. **Task 1 below is that work again, done citeably.** It is the single most valuable thing you can do next.

1. TASK 1 — Equalization, re-done with real citations (highest priority)

One provision per entry. Every entry carries its own section number. No clusters, no “illustrative” bundles, no summarising several provisions into one quote. If a section contains eight definitions that each name a source, that is eight entries.

Instrument: **Federal-Provincial Fiscal Arrangements Regulations, 2007 (SOR/2007-303)**, current consolidation, at <https://laws-lois.justice.gc.ca/eng/regulations/SOR-2007-303/FullText.html>. Note it paginates — pages 1 through 12 — and the earlier sweep evidently did not reach the later pages.

Work through **these sections specifically**, in this order:

1. **s. 5 — Revenue Base** (Division 1, Equalization). This is the core. Page 3.
2. **s. 3.1 — Interpretation** (already partly extracted; redo it with correct section and subsection references so it becomes citable). Page 2.
3. **s. 11 — Population**, and **s. 12 — Certificate**. Page 6.
4. **s. 8 — Revenue Base** (Division 2, Nova Scotia). Pages 5-6.
5. **ss. 19, 22, 23, 24** — Territorial Formula Financing revenue base, gross expenditure base, population adjustment factor, and the Provincial-Local Government Expenditure Index. Pages 9-10.
6. **Part 2 (ss. 32 onward)** — Fiscal Stabilization. Page 11.

Use FORMAT S from Brief II:

INSTRUMENT: <full citation>
URL: <link to the specific page>
PROVISION: <exact section, subsection, paragraph — e.g. "s. 5(1)(c)(ii)">
QUOTE: "<verbatim text of that provision alone>"
NAMES: <every statistical series, index, survey, table or dataset named>
DEFINED-AS: <if a term is defined elsewhere, quote that provision too, with its own section number>

One claim to settle first

You reported that the Regulations name the **Survey of Employment, Payrolls and Hours** as the basis for a payroll revenue base:

“the gross dollar value ... of the payrolls of all employers ... as determined by Statistics Canada on the basis of its Survey of Employment, Payrolls and Hours”

That phrase could not be found in the sections retrieved so far. It is not disproven — the retrieval truncated before reaching the Revenue Base sections where it would sit — but it is unverified.

This matters more than anything else in the brief: SEPH is already a node in the graph and currently ranks **6th by authority**, so a documented edge into it from the Equalization formula is high-value. **Find the exact provision, or report that you cannot.** Both answers are useful. A wrong one is not.

Same treatment for these, all currently unverified: **CANSIM 127-0007** (electric power generation), **183-0024** (alcoholic beverages), **002-0020** (agricultural sector balance sheet). Confirmed already present, so no need to re-check: 405-0004, table 23-10-0066-01, *Gasoline and Other Petroleum Fuels Sold, Census of Agriculture*.

2. TASK 2 — The eight-issue MPR source-line sweep

Not started, and still the round where your lack of rate limits matters most. Pure extraction, zero judgement.

Take the **last eight issues of the Bank of Canada Monetary Policy Report** (July 2026 back through roughly October 2024), PDFs preferred. For **every chart, table and figure**, transcribe the source line verbatim with its number and issue date.

Return a flat list. Do not deduplicate, group, or summarise. The frequency of each distinct attribution string is the finding, and that is destroyed by tidying.

Separately, capture **every footnote naming a data source**. Footnote 4 of the July 2026 issue — the LFS-Micro one — is the model, and it is precisely the kind of thing that never appears in a source line. That single footnote settled an edge that had been open for four sessions; there are likely more like it across eight issues.

Expected payoff: the Bank names releases in footnotes and not in source lines, so this sweep should convert several currently-unprovable edges into provable ones, and will probably surface sources nobody has thought to look for.

3. TASK 3 — Adversarial round: try to break existing edges

Not started. Highest value per unit of effort, because removing a wrong edge is worth more than adding a right one.

Use FORMAT J, which requires a written counter-case before any conclusion. “No counter-argument” is not an acceptable answer.

TARGET: <the edge>
CASE FOR: <quotes supporting it>
CASE AGAINST: <the strongest real argument this edge should not exist>
CONCLUSION: <which is stronger, and by how much>

Eight edges marked implied — believed on strong grounds, no document states them. Your task is to falsify. A confirmation is the lesser result.

1. gp-financial-statements → gp-tax-rate-bylaw (City of Grande Prairie)
2. cgp-financial-statements → cgp-assessment-roll (County of Grande Prairie)
3. cgp-budget → ab-municipalaffairs-lgff-capital
4. gppsd-financial-statements → psab-psas
5. ab-child-family-benefit → canada-child-benefit
6. ab-oil-par-prices → nymex-wti-settlement-prices
7. ab-dip-requisition → ab-oilsands-royalty-rates
8. cihi-nhex → canada-health-transfer

Four edges currently marked documented. If any is weaker than it looks, that is the most valuable finding available here:

9. canada-health-transfer → statcan-population-estimates — does the instrument name the *quarterly demographic estimates*, or the census?
10. fiscal-equalization-program → statcan-population-estimates — same question.
11. bea-pce → bls-cpi — does the NIPA Handbook support `calculated_from`, or something weaker?
12. **boc-mp → bea-gdp — your own find.** Attack it. Does “*via Haver Analytics*” break the claim that the MPR uses the BEA release directly, or is the intermediary irrelevant? Genuine

question, and your view is wanted. Do not fold simply because you are being asked to attack it.

4. TASK 4 — US Treasury daily yield curve (restores a lost node)

The Fed's **H.15 Selected Interest Rates** was deleted from the graph and now exists nowhere in it. Its previous edge claimed H.15 reports the FOMC target range; the release was checked and carries **no target-range series at all**, with its only federal funds line sourced to the FR 2420 reporting form.

But H.15 does name a source. Footnotes 9 and 10 both read "**Source: U.S. Treasury**", and the release describes the yields as "*interpolated by the U.S. Treasury from the daily yield curve.*"

Research the **Treasury daily yield curve / interest rate statistics** release well enough to become a node: official title, publisher, stable URL, releases per year, one-line description. Then extract, in FORMAT E, passages supporting the edge from H.15 to it — and anything on Treasury's side describing how the curve is built.

This is the cheapest available route to restoring a federal release to the graph.

5. TASK 5 — SEP definitional text, verbatim and complete

Short, precise, and currently blocking two edges.

From the **Summary of Economic Projections**, last four meetings: extract the **full text of the table notes and footnotes** that define what each projected variable means — specifically the **unemployment rate** projection and the **change in real GDP** projection.

Verbatim and complete, not summarised. The question these settle is whether the SEP pins its unemployment projection to a **named survey**. If it names the **Current Population Survey**, note that the CPS is already a node (cps-current-population-survey) and the correct edge runs there rather than to the Employment Situation release.

Do not adjudicate. Quote the definitions and let them be read.

6. Standing rules

The one rule: if no document explicitly names the source, the edge does not exist. Naming an *agency* is not naming a *release*.

AGENCY ONLY is a first-class answer. When a source line names Statistics Canada and no release, write that. It is a result, not a failure — and it is where the single error of the last two rounds came from.

Never override your own doubt silently. If you notice a problem — a quote pointing the opposite way, a section number you are unsure of — record it prominently and leave it unresolved. A flagged uncertainty is actionable. A confident wrong answer is not.

Cite precisely. Every quote needs the exact section, page, footnote or chart number it came from. This is what stopped Round A being usable, and it is the one thing to get right this time.

Report per task as you go. Do not hold everything for a single complete reply.

Social media: finding aid only. Follow it to a primary document, read that, cite that.

7. Priority

1. **Task 1** — Equalization, citeably. Settle the SEPH provision first.
2. **Task 2** — the eight-issue MPR sweep.
3. **Task 3** — the adversarial round.
4. **Task 4** — Treasury yield curve.
5. **Task 5** — SEP notes.

Volume welcome. Length welcome. Raw welcome. Certainty neither required nor, in Tasks 1, 2, 4 and 5, wanted.
